

Matlab Tip -- 1

2010/10/23

This is a script that can be run to "unlock" some of the options for scopes. It will allow the user to treat the scope as a regular figure and allows editing; also very useful for removing the black background color.

First select the scope you wish to manipulate.

Then enter the commands:

```
shh = get(0,'ShowHiddenHandles');  
set(0,'ShowHiddenHandles','On')  
set(gcf,'menubar','figure')  
set(gcf,'CloseRequestFcn','closereq')  
set(gcf,'DefaultLineClipping','Off')  
set(0,'ShowHiddenHandles',shh)
```

This action 'breaks' the normal functionality of the scope. To return it to normal functionality simply close the scope window and reopen it.

Enjoy!
